

Ansible Section 2 - How Ansible works?

Task in ansible is something which comprises of one or more than one modules. A module is a command which ask ansible to perform some certain task.

Sometimes modules can be also more than one. So the group of modules are also called as task.

If there are more than one module in a task then it means that all the modules are interconnected. Then they collectively are called as task.

When two or more tasks are kept together then they are called a play. And group of play makes a playbook which is the main ansible file.

This file is written in Yaml language.
